SUMMARY LANGUAGE: English

AB The pseudopterodins are a family of diterpene glycosides isolated from the gorgonian coral Pseudopterogorgia elisabethae. These metabolites exhibit potent anti-inflammatory activity, and this review describes our efforts to elucidate their biosynthetic origin. A radioactivity-guided isolation was used to identify the terpene

cyclase product. In addition, a detailed NMR-guided search for potential biosynthetic intermediates identified metabolites which were tested by incubating ³H-labeled analogues with a cell-free extract of the coral. All labeled metabolites were generated biosynthetically, and radiochemical purity was established by a combination of HPLC purification and derivatization. In summary, pseudopterins are produced by a cyclization of geranylgeranyl diphosphate to elisabethatriene, aromatization to erogorgiaene, two successive oxidations to 7,8-dihydroxyerogorgiaene and a glycosylation to afford a seco-pseudopterosin as a key intermediate. A dehydrogenation leads to amphilectosins which undergo ring closures to yield the pseudopterins. .COPYRGHT. Society for Industrial Microbiology 2006.

DOCUMENT TYPE: Journal

LANGUAGE: English

AB The Bahamian octocoral Pseudopterogorgia elisabethae is the source of pseudopterins, diterpene glycosides with potent anti-inflammatory activity. The first committed step in pseudopterosin biosynthesis comprises the cyclization of the universal diterpene precursor geranylgeranyl diphosphate to elisabethatriene. This reaction is catalyzed by elisabethatriene synthase, which was purified to homogeneity from a crude coral extract. This represents the first purification to apparent homogeneity of a terpene cyclase from any marine source. The reaction kinetics of elisabethatriene synthase was examined using a steady state approach with ³H-labeled isoprenyldiphosphates varying in carbon chain length (C10, C15, C20). For the reaction of elisabethatriene synthase with its natural substrate geranylgeranyl diphosphate, values of K_m (2.3×10^{-6} M), V_{max} (3.4×10^4 nM elisabethatriene⁻¹ s⁻¹) and the specificity constant ($k_{cat}/K_m = 1.8 \times 10^{-10}$ M⁻¹ s⁻¹) were comparable with diterpene cyclases from terrestrial plants. Elisabethatriene synthase also catalyzed the conversion of C15 and C10 isoprenyldiphosphate analogs to monoterpene and sesquiterpene olefins, resp. Kinetic parameters indicated that substrate specificity and K_m of elisabethatriene synthase decreased with decreasing isoprenoid carbon chain length. Furthermore, GC-MS anal. showed increased product diversity with decreasing isoprenoid carbon chain length.

AB The invention provides sequences of novel peptides of a diterpene cyclase from *Pseudopterogorgia elisabethae*. The purified enzyme has an apparent mol. weight of about 47 kilodaltons and an isoelec. point of about 5.1. The purified enzyme catalyzed the cyclization of geranyl geranyl diphosphate to elisabethatriene.

NUMBER OF CLAIMS: 8
GRAPHICS INFORMATION: 4 Drawing Sheet(s), 4 Figure(s).

DESCRIPTION OF FIGURES:

FIG. 1 is a schematic overview of pseudopterostin/secopseudopterostin biosynthesis pathways.

FIG. 2 is sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) analysis of chromatography fractions. Lane: 1) Low Molecular Weight Standard,

2) Cell-Free Extract, 3) Ion Exchange, 4) Dye Ligand, 5) Hydroxyapatite, 6) Purified Gel Slice.

FIG. 3 is a schematic overview of the chemical transformation of elisabethatriene to elisabethadione.

FIG. 4 is a set of amino acid sequences (SEQ ID NOs:1-4) corresponding to elisabethatriene cyclase peptide fragments purified from *P. elisabethae*.

AB An enzyme having diterpene cyclase activity has been purified from *P. elisabethae* using a series of chromatography steps. The purified enzyme has an apparent molecular weight of about 47 kilodaltons and an isoelectric point of about 5.1. The purified enzyme catalyzed the cyclization of geranyl geranyl diphosphate to elisabethatriene.

AB The pseudopteroinins are diterpene glycosides isolated from *P. elisabethae*, which exhibit anti-inflammatory and analgesic activity greater than the industry standard, indomethacin. Previously, the authors isolated the pseudopteroin diterpene cyclase product, elisabethatriene, using a radioactivity-guided isolation. Identification of this metabolite, and the conversion of labeled geranylgeranyl diphosphate to elisabethatriene, provided the authors with an assay to guide the isolation of the enzyme responsible for this cyclization. Here, the soluble protein preparation from

P. elisabethae was partially purified (.apprx.15,000-fold) using a combination of low-resolution anion-exchange, low-resolution hydrophobic-interaction, high-resolution hydroxylapatite, and high-resolution anion-exchange chromatogs. The diterpene cyclase was identified by comparing the mol. weight from gel permeation chromatog. (.apprx.47 kDa) with those of protein bands from purified fractions using SDS-PAGE. Kinetic anal. and evaluation of amino acid inhibition studies indicated that the enzyme displayed similar characteristics to other terpenoid cyclases isolated from terrestrial sources. This report represents the 1st purification and characterization of a terpene biosynthetic enzyme from a marine invertebrate.

PARENT CASE DATA:

The present application claims the priority of U.S. provisional application No. 60/351,984 filed Jan. 25, 2002.

NUMBER OF CLAIMS: 16 4 Figure(s).
DESCRIPTION OF FIGURES:

FIG. 1 is a schematic overview of pseudopteroin/secopseudopteroin biosynthesis pathways.

FIG. 2 is sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) analysis of chromatography fractions. Lane: 1) Low Molecular Weight Standard, 2) Cell-Free Extract, 3) Ion Exchange, 4) Dye Ligand, 5) Hydroxyapatite, 6) Purified Gel Slice.

FIG. 3 is a schematic overview of the chemical transformation of elisabethatriene to elisabethadione.

FIG. 4 is a set of amino acid sequences (SEQ ID NOs:1-4) corresponding to elisabethatriene cyclase peptide fragments purified from *P. elisabethae*.

AB An enzyme having diterpene cyclase activity has been purified from *P. elisabethae* using a series of chromatography steps. The purified enzyme has an apparent molecular weight of about 47 kilodaltons and an isoelectric point of about 5.1. The purified enzyme catalyzed the cyclization of geranyl geranyl diphosphate to elisabethatriene.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Disclosed herein are pseudopterosin compounds obtained from Symbiodinium spp. symbionts. Also disclosed are methods of obtaining, isolating, purifying or preparing at least one pseudopterosin compound comprising obtaining, isolating, purifying or preparing the pseudopterosin compound from at least one Symbiodinium spp. symbiont. In preferred embodiments, the host is Pseudopterogorgia, preferably, *P. elisabethae*. As disclosed, preferred pseudopterosin compounds and pseudopterosin compositions are of non-animal origin, substantially free of animal impurities, or both. Treatment methods using the pseudopterosin compounds and compositions are also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The pseudopterosins are a family of diterpene pentosides isolated from the marine octocoral, Pseudopterogorgia elisabethae. These compds. possess non-steroidal anti-inflammatory and analgesic properties which have been shown to be greater than the industry standard, indomethacin. In our investigations, we are interested in examining the biosynthesis and enzymol. of these compds. for the development of a biotechnol. production method. We have isolated the pseudopterosin diterpene cyclase product, elisabethatriene, using a radioactivity-guided isolation. This has provided us with an assay to isolate the diterpene cyclase enzyme. The amino acid sequence of the purified diterpene cyclase will facilitate cloning and expression of the gene in a suitable host. In addition, we have identified over 25 novel diterpenes from one of our collections of *P. elisabethae*. Several of these compds. appear to be involved in pseudopterosin biosynthesis and are presently being evaluated as potential intermediates. These compds. have also been evaluated for anti-inflammatory activity and some possess greater activity than that of the pseudopterosins. We therefore propose a production method utilizing a combination of recombinant enzyme technol. and synthetic methods/biocatalysis in order to produce one or more anti-inflammatory metabolites in *P. elisabethae*.

AB Putative precursors in pseudopterosin biosynthesis, the hydrocarbons
isoelisabethatriene and erogorgiaene, have been identified from an extract of
Pseudopteroergorgia elisabethae collected in the Florida Keys. Biosynthetic
expts. designed to test the utilization of these compds. in pseudopterosin
production revealed that erogorgiaene is transformed to pseudopterosins A-D.
Together with our previous data, it is now apparent that early steps in
pseudopterosin biosynthesis involve the cyclization of geranylgeranyl
diphosphate to elisabethatriene followed by the dehydrogenation and
aromatization to erogorgiaene.

AB The intermediate representing the first committed step in the
pseudopterosin biosynthetic pathway has been discovered using a
radioactivity-guided isolation. This diterpene cyclase product
was identified from a cell-free extract of the marine soft coral,
Pseudopteroergorgia elisabethae, which was incubated with
3H-geranylgeranyl diphosphate. Structural studies of the compound have
revealed an unexpected bicyclic skeleton suggesting that the
pseudopterosins are related to the seco-pseudopterosins through a common
bicyclic intermediate. In addition, the intermediacy of this metabolite in
pseudopterosin biosynthesis has been confirmed utilizing a cell-free extract
of P. elisabethae.
